Azathioprine For Inflammatory Bowel Disease (Adults)

It is vital for safe and appropriate patient care that there is a clear understanding of where clinical and prescribing responsibility rests between Consultants and General Practitioners (GPs).

This guideline reinforces the basic premise that:

When clinical and/or prescribing responsibility for a patient is transferred from hospital to GP, the GP should have full confidence to prescribe the necessary medicines. Therefore, it is essential that a transfer of care involving medicines that a GP would not normally be familiar with, should not take place without the “sharing of information with the individual GP and their mutual agreement to the transfer of care.”

These are not rigid guidelines. On occasions, Consultants and GPs may agree to work outside of this guidance. As always, the doctor who prescribes the medication has the clinical responsibility for the drug and the consequences of its use.

Indications:
Azathioprine has immunosuppressive and steroid-sparing properties. It is used locally for resistant or frequently relapsing Crohn’s disease and Ulcerative Colitis, and also for dermatological/rheumatological conditions.

Treatment for patients with Crohn’s disease (unlicensed indication) must be initiated on Consultant Gastroenterologist advice only.

Dosage and administration:
The usual starting dose is 50mg daily for 2 weeks. This should be increased to 100mg daily and, depending on response and haematological tolerance, to a typical maintenance dose of 2-2.5mg/kg/day.

When the therapeutic response is evident, this dose can be maintained, although consideration can be given to reducing the maintenance dose to the lowest level that maintains the response.

Patients with renal or hepatic insufficiency should be given the lowest effective dose.

Azathioprine is taken as a single dose after food.

Additional Information
- Mercaptopurine is the active metabolite of azathioprine.
- Pneumovac® II and annual influenza vaccine is recommended.
- Passive immunisation should be carried out in non-immune patients exposed to chickenpox or shingles, using Varicella Zoster Immunoglobulin.

Monitoring requirements:
Before treatment:
- Full blood count (FBC) including platelets, urea and electrolytes (U&Es), creatinine and liver function tests (LFTs) (hospital)
- Test for thiopurine methyl transferase (TPMT), as a deficiency increases the risk of myelosuppression

During treatment:
- FBC weekly for the first four weeks, then monthly for 3 months thereafter if stable. Once fully stabilised, monitoring can be every 3 months
- LFTs and U&Es weekly for the first four weeks, then monthly thereafter if stable.
- If dose is increased, repeat FBC and LFTs after 2 weeks, and then return to monthly.

For patients with Crohn’s disease and Ulcerative Colitis, responsibility for monitoring, once stable, rests with the GP

Action to be taken if abnormal results/adverse effects:
- WBC < 3.5 x 10^9/l Check neutrophil count
- Neutrophils < 2.0 x 10^9/l Monitor weekly. If it falls below 1.5 x 10^9/l STOP DRUG and contact GI consultant.
- Platelets < 150 x 10^9/l Contact hospital
- 3 fold rise in ALT/AST Monitor weekly. If ALT continues to rise, contact hospital
- Rash Mild, drug can be continued at reduced dose if necessary. Severe – STOP azathioprine and contact hospital
- Oral ulceration Repeat FBC and act on results as above
- MCV > 105fl Check B12 and Folate and, if low, start appropriate supplements
- Abnormal bruising Repeat FBC and act on results as above
- Sore throat Repeat FBC and act on results as above
- Drug-related acute shortness of breath STOP DRUG, contact hospital and if severe, refer to Medical Admissions Unit, Arrowe Park Hospital
- Sudden cough If persistent, organise chest X-Ray and if abnormal, contact help line

Please note that in addition to absolute values for haematological indices, a rapid fall or a consistent downward trend in any value should prompt caution and extra vigilance.
For patients with an inherited deficiency of the TPMT enzyme, lower doses of azathioprine should be used and it should also be administered with caution in patients receiving aminosalicylate derivatives eg olsalazine, mesalazine or sulfasalazine as these drugs inhibit TPMT.

A diminished response to killed vaccines is likely.

Cautions:
- Renal or hepatic insufficiency may enhance the toxicity of azathioprine. The haematological response should be carefully monitored and doses at the lower end of the range should be used.
- Increased risk of skin cancers; avoid exposure to sunlight and UV light by using sunscreen and protective clothing.

**Adverse Effects:**
Depression of bone marrow function, leucopenia, thrombocytopenia, anaemia and other blood disorders.
Viral, fungal and bacterial infections.
Neoplasms, including non-Hodgkin’s Lymphomas, skin cancers, sarcomas and uterine cervical cancer.
Nausea, pancreatitis, altered liver function, alopecia, hypersensitivity reactions, SJS, toxic epidermal necrolysis.

**Specialist responsibilities:**
1. Confirm the diagnosis of Inflammatory Bowel Disease (IBD) and discuss with the patient the benefits and side effects of treatment with azathioprine. If the patient is a woman of child bearing potential ensure that they are aware of the importance of effective contraception and the need to discuss with their consultant if they wish to become pregnant.
2. Ensure baseline monitoring of full blood count, biochemical profile and TPMT, also subsequent monitoring until dose is stabilised.
3. Review the patient after one month (this can be in the gastroenterology specialist nurse clinic) and if the patient is tolerating and benefiting from azathioprine at this first visit, a written request should be made to the GP to continue prescribing the medication and to continue the monitoring.
4. Prescribe the initial 2 months of azathioprine during the trial period and discontinue if no response or significant adverse effect.
5. Provide the patient with a shared care booklet and enter the blood results into the booklet.
6. Regularly review the patient to monitor efficacy of the treatment and the ability to tolerate it, and consider whether continuation of treatment is appropriate.
7. Communicate promptly with the GP when treatment is changed and each time the patient is seen.
8. Undertake any necessary monitoring at review appointments.
9. Ensure clear backup arrangements exist for GPs for advice and support.
10. Report serious adverse events to the Committee on Safety of Medicines (CSM).

**GP responsibilities:**
1. Initial referral to Consultant Gastroenterologist raising the possibility of IBD.
2. Provide the patient with monthly repeat prescriptions of medication once the specialist has recommended continuation therapy.
3. Continue monitoring as outlined on the first page and document the results in the shared care booklet.
4. Ensure patient’s shared care booklet and practice computer system are updated with any dose changes.
5. Report any adverse effects to the consultant.
6. Refer back to the consultant if the patient’s condition deteriorates or if there is a change in the patient’s status.
7. Contact the consultant if they do not agree with the treatment recommendation, or if there is a perceived problem with compliance or concordance, or if they have any questions about the management plan.
8. Administer Pneumovac® II and annual influenza vaccines.
9. Administer Varicella Zoster Immunoglobulin in non-immune patients exposed to chickenpox or shingles.

**Patient responsibilities:**
1. Read the written information provided about the drug and have a clear understanding of the risks / benefits of oral azathioprine treatment.
2. Attend for blood tests.
3. Allow at least 48 hours for the prescription from the GP to be generated once they have agreed to take on prescribing.
4. Report any adverse effects, concerns or lack of understanding of the treatment to the GP or specialist.
5. Limit alcohol to national safe limits.
6. Take monitoring booklet every time the patient sees their GP, has a hospital appointment or visits the pharmacist.

**Secondary care review:** Patients will be reviewed one month after starting azathioprine and thereafter at a frequency determined by the clinical need by the consultant clinic, or if requested to review by the GP.

**Availability:**
- 25mg tablet: 28 = £3.77
- 50mg tablet: 56 = £3.83

**Back up advice and support:**
- IBD Specialist Nurse
- Telephone: 0151 604 7459
